Clearance

Before mounting the bearing to the shaft or housing, fix the inner ring or the outer ring, and move the other unfixed ring in the radial or axial direction, the amount of movement is called the bearing clearance, or the axial clearance.

The amount of clearance while the bearing is rotating (the so-called working clearance) shall have effects on the rolling fatigue life, temperature rise, noise, vibration and other functions.

In order to get the stable value of the clearance, normally a required load is put on the bearing in order to measure the bearing clearance.

Therefore, the measured value is larger than the true clearance (called the theoretical clearance), which means the amount of the elastic deformation caused by the load is increased.

But for roller bearings, this elastic deformation can be ignored since it is comparatively small.

Before the mounting of the bearing, the internal clearance is expressed with the theoretical clearance.

The selection of clearance

If the amount of expansion or contraction of the rings caused by the interference fit when mounting the bearing on the shaft or in the housing is deducted from the theoretical clearance, then we have the "Mounting Clearance".

Furthermore, if the dimensional changes caused by the temperature difference inside the bearing is added to or reduced from the mounting clearance, we have the so-called "Effective Clearance".

When the bearing rotates while carrying a certain magnitude of load in the machine, if the elastic deformation caused by the load is added to the effective clearance, we then have the "Working Clearance".

when the working clearance is a slightly negative, the bearing has the longest service life. But with the negative clearance changing to be positive, the fatigue life shall decrease. Therefore, when choosing the clearance, it is preferred to choose the 0 or slightly positive working clearance.

Bearing Material:

To ensure bearings quality, we only buy bearings material from reputable, authorized, and large steel plant, and each material will be strictly inspection before production. The following materials especially GCr15SiMn are widely used in our bearing series. Chemical Composition of Steels for DWCFQ bearings

Material Chemical Composition									
Element	C	Si	Mn	Cr	Ni	Mo	P	S	Cu
GCr15	0.95-1.05	0.15-0.35	0.25-0.45	1.40-1.64	---	---	<=0.025	<=0.025	---
GCr15SiMn	0.95-1.05	0.45-0.75	0.95-1.25	1.40-1.64	---	---	<=0.025	<=0.025	---

Purposes and methods of lubrication.

Lubrication has important effects on the function of the bearing. Whether the lubricant and the method are suitable or not shall influence the bearing life. The advantages of lubrication:

- 1) Reducing the friction and wear by lubricating every part of the bearing.
- 2) Taking away the heat generated inside the bearing caused by friction or other reasons.
- 3) Forming an oil film in the rolling contact surface in order to elongate the bearing life.
- 4) Preventing the bearing from rusting and dust contamination.

The lubricating methods include oil lubrication and grease lubrication. The comparisons of these two methods are given in Table1.

Grease lubrication

Grease put inside the bearing can last a comparatively long time without replenishment, and the sealing device is very simple. Therefore it is extensively applied.

There are two methods for grease lubrication: one is to put the grease inside the sealed bearings in advance, the other is to fill the grease of certain amount inside the housing and refill it or change the grease inside at intervals.

Moreover, for machine with several bearings requiring lubrication, the method of centralized greasing through pipes connecting the places to be lubricated is adopted.

1) Amount of lubricating grease

The amount of lubricating grease to be filled in the housing depends on the structure and volume of the housing. Normally it is preferred to fill the volume by 1/3 to 1/2.

If too much grease is filled, the grease may turn bad, age or soften due to the heat caused by rotation.

But for bearings with low rotation speed, sometimes 2/3 to the whole volume shall be filled with grease in order to avoid the intrusion of foreign matters.

2) The replenishment and change of grease

The replenishment and change of grease is closely related to the lubricating method. No matter which method is applied, the grease must be clean and care be taken to avoid intrusion of dirt.

The grease to be replenished with should be of the same brand.

Try to ensure that the replenished grease has entered into the inside space of the bearing.

Oil lubrication Oil lubrication is applied to high-speed and heat-resistant bearings and ineffective for reducing vibration and lowering noise. Mostly it is used in cases where the grease lubrication is not suitable. Oil lubrication has the following methods:

- | | | |
|---------------------------------|--------------------------|--------------------------|
| (1) Oil bath lubrication | (2) Oil drip lubrication | (3) Splash lubrication |
| (4) Oil circulating lubrication | (5) Oil jet lubrication | (6) Oil mist lubrication |
| (7) Oil air lubrication | | |

Table1 Comparisons between oil lubrication and grease lubrication		
Item	Grease	Oil
Sealing device	Simple	More complicated, requiring maintenance
Lubricating function	Good	Very good
Rotational speed	Low speed to medium speed	Applicable to high speed
Change of lubricant	Troublesome	Simple
Life of lubricant	Very short	Long
Cooling effects	Without	Possible using forced oil circulation
Elimination of inclusion	Impossible	Easy

Bearing Selection:

Bearing Type		
It is critical to understand the use conditions of the bearing when choosing the type of bearing. Table1 provides the main factors to be analyzed. Table1 (1) Selection of bearing type		
Items for analyses		Methods of choice
1)Mounting space	Those can be put in the mounting space	Since the rigidity and strength of the shaft have been considered in the designing, first of all the inner diameter of the bearing must be determined. But there are too many dimensional series and types, the most appropriate type must be chosen.
2)Load	Strength, direction and nature of the load	<p>The load is subject to changes, such as the amount of the load, whether there is only radial load or not, whether the axial load is in single-direction or double direction, the amount of vibration or shock and others. These factors must be considered before choosing the most appropriate bearing type.</p> <p>Normally, the radial load carrying capacity of the bearings with the same ID are listed in the following order:</p> <p>[deep groove ball bearings<angular contact ball bearings<cylindrical roller bearings<taper roller bearings<spherical roller bearings]</p>
3)Rotating speed	Those are suitable for the mechanical rotations.	<p>The limit speed of the bearing rests with not only the bearing type but also bearing dimensions, cage type, precision, load carrying conditions and lubrication methods. These factors must be considered for the choice.</p> <p>The following bearings are applied for high speed rotation:</p> <p>[deep groove ball bearings<angular contact ball bearings<cylindrical roller bearings]</p>
4)Rotating precision	Those can satisfy the rotation precision requirements	<p>Machine tool spindles, ages turbines and control machines entail high rotation precision, high speed and low friction. Bearings with precision degree 5 or over should be applied in these cases.</p> <p>Normally the following bearings are applied:</p> <p>[deep groove ball bearings, angular contact ball bearings, cylindrical roller bearings]</p>

Bearing Type		
It is critical to understand the use conditions of the bearing when choosing the type of bearing. Table1 provides the main factors to be analyzed. Table1 (1) Selection of bearing type		
Items for analyses		Methods of choice
5)Rigidity	Those can satisfy the rigidity of mechanical shaft system	In machine tool spindles and final deceleration device of automobiles and other applications, the rigidity of the bearing must be increased when the rigidity of the shaft is increased.
	[When carrying load, the contact surface between the rolling elements and the raceways can have elastic deformation. "High rigidity" means such elastic deformation shall happen at the smaller amount.]	The deformation of roller bearings when carrying load is smaller than that of the ball bearings.
		Rigidity can be increased by applying pre-load (negative clearance). These method is suitable for angular contact ball bearings and taper roller bearings.

Table1(2) The selection of bearing type		
6)The relative leaning of the inner ring and outer ring	Reason of leading to the relative leaning of the inner ring and outer ring must be analyzed (such as the load-included bending of the shaft, poor precision of the shaft and housing or mounting error) and the bearings that fit these conditions should be chosen.	If the relative leaning between the inner ring and outer ring is too big, the inside load thereof shall do harm to the bearing. So bearing types that can carry this leaning should be chosen.
		Normally, the allowable sloping angle increases with the following order:
		[cylindrical roller bearings, taper roller bearings, deep groove ball bearings (angular contact ball bearings), thrust ball (spherical roller) bearings]
7)Mounting and dismounting	Check the frequency and methods of mounting and dismounting of the bearings regularly.	If too much mounting and dismounting, choosing cylindrical roller bearings with separable inner ring and outer ring, needle roller bearings and taper roller bearing is comparatively convenient.
		With adapter or withdrawal sleeve, self-aligning ball bearings with tapered bore and spherical roller bearings with tapered

Bearing Structure		
The variety of machine types, combined with the differences in the application condition leads to different requirements for bearings normally, there will be no less than two bearings applied on one shaft.		
In addition, for the purpose of convenience in fixing axial position, normally one bearing is used to fix one end and the others free on the other end of the shaft. The following table provides the choice on bearings on the fixing end and on the free end of the shaft.		
Table1 Bearings on the fixing end and the free end		
	Content	Applicable bearing types
Bearings on the fixing end	Fix the bearing in the axial direction	Deep groove ball bearings
	Choose bearings that can carry both the radial load and the axial load	Combined angular contact ball bearings
	In order to carry double-direction axial load, strength must be considered according to the amount of the axial load while mounting	Self-aligning ball bearings
		Cylindrical roller bearings with flanges (NUP and NH types)
		Double-row taper roller bearings
		Spherical roller bearings
Bearing on the free end	The bearing must adapt to the shaft expansion caused by the changes in temperature while working and adjust the bearing position in the axial direction.	Separable cylindrical roller bearings (NU or N type)
	Only the bearings with separable inner ring and outer ring that can carry radial load should be chosen.	Non-separable types
	With non-separable bearings, there should be a clearance between the outer ring and housing in order to adapt the bearing to the shaft expansion in the axial direction.	Deep groove ball bearings
	Sometimes, the adaptation is achieved with the contact surface between the shaft and the inner ring.	Combined angular contact ball bearings (back-to-back arrangement)
		Double-row angular contact ball bearings
		Self-aligning ball bearings
		Double-row taper roller bearings(3700 type)
		Spherical Roller bearings

	Content	Applicable bearing types
Regardless of fixing end or free end	When the distance between the two bearings is small, and the effects of shaft expansion are not important, two angular contact ball bearings or taper roller bearings that can carry axial load can be used together in face-to-face or back-to-back arrangements.	Deep groove ball bearings
	Use screw nut or filling piece to adjust the axial clearance after mounting.	Angular contact ball bearings
		Self-aligning ball bearings
		Cylindrical roller bearings (NJ and NF types)
		Taper roller bearings
Vertical shaft		Spherical roller bearings
	Bearings that can carry both radial load and axial load should be chosen for the fixing end. If the axial load is too big, use the combination of thrust bearing and radial bearing.	For fixing end
	Similarly, only bearings that can carry radial load should be used to adapt to the shaft expansion.	Combined angular contact ball bearing (back-to-back arrangement)
		Double-row taper roller bearings(37000 type)
		Combined thrust bearing and radial bearing arrangements

Cage damage
Broken cage

Possible reasons

- Torque load too big
- High speed rotation or speed changing too frequently
- Poor lubrication
- Intrusion of foreign matter
- Vibration too big
- Bad mounting (mounting in leaning conditions)
- Abnormal increase in temperature (resin cage)

Solutions

- Check application conditions
- Check lubrication conditions
- Re-consider choice of cage
- Pay attention to applications
- Consider rigidity of shaft and bearing box

Cracks

Partial breach and even cracks

Possible reasons

- Shock load too heavy
- Interference too big
- Big peeling off and frictional cracks
- Poor precision of the mounting side (corner circle too big)
- Frictional cracks
- Mal-applications (using copper hammer, intrusion of big foreign matter)

Solutions

- Check the application conditions
- Set proper interference and check material quality
- Improve mounting and application methods
- Prevent frictional cracks (check lubricants)
- Check bearing surrounding design

Burns

Overheat color varying then bearing, leading to failure to rotate

Possible reasons

- Clearance too small (including clearance for the deforming part)
- Insufficient lubrication or inappropriate lubricant
- Load too heavy (pre-load too heavy)
- Skewing rollers

Solutions

- Choose proper clearance (increasing clearance)
- Check lubricant type and ensuring amount
- Check application conditions
- Avoid position error
- Check surrounding design (including lead to bearing)
- Improve the mounting method

Rusting

Rusting on all or part of the surface

Rust on rolling elements in pitch shape

Possible reasons

- Poor maintenance
- Improper packaging
- Insufficient rust-preventive
- Intrusion of moist acid liquid
- Taking the bearing by hands

Solutions

- Maintenance to prevent rusting
- Reinforcing the sealing function
- Check the lubricant regularly
- Pay attention to bearing applications

Corrosion
Red corroded particles in the fit surface

Possible reasons

- Insufficient amount of interference
- Small bearing oscillating angle
- Insufficient lubrication (or without lubrication)
- Not stable load
- Vibration in the transit

Solutions

- Check the interference and the conditions of the lubricant
- Separable packing of inner rings and outer rings when in transit, pre-load shall prevail if the bearings are un-separable
- Re-consider choice of lubricant
- Re-consider choice of bearings

Wear

Surface worn, leading to dimension changes with scratches and traces

Possible reasons

- Foreign matters in the lubricant
 - Poor lubrication
 - Rollers skewing
- Solutions
- Check lubricant and lubrication method
 - Reinforce sealing function
 - Prevent positioning error

Electric corrosion
Red corroded particles in the fit surface

Possible reasons

- Insufficient amount of interference
- Small bearing oscillating angle
- Insufficient lubrication (or without lubrication)
- Not stable load
- Vibration in the transit

Solutions

- Check the interference and the conditions of the lubricant
- Separable packing of inner rings and outer rings when in transit, pre-load shall prevail if the bearings are un-separable
- Re-consider choice of lubricant
- Re-consider choice of bearings

Dent and bruise

Intrusion of solid foreign matter or pits in the surface caused by shock or scratches from mounting

Possible reasons

- Solid foreign matter intrusion
- Peels inside the bearing
- Shock from mal-mounting peeling off
- Mounting in leaning conditions

Solutions

- Improve mounting and application methods
- Prevent foreign matters from intruding
- Check other parts if caused by metal pieces

Creep deformation

Slippery ID surface and OD surface leading to mirror surface and sometime blocking

Possible reasons

- Insufficient interference at the fit surface
- Sleeve not fastened enough
- Abnormal increase in temperature
- Load too heavy

Solutions

- Re-consider the interference amount
- Consider the application conditions
- Check precision of shaft and bearing box

Peeling off

Peeling off and deformation of the rotational surface

Possible reasons

- Load too heavy or improper applications
- Mal-mounting
- Poor precision of the shaft or bearing box
- Clearance too small
- Intrusion of foreign matters
- Rusting
- Hardness decrease caused by abnormal high temperature

Solutions

- Re-consider the application conditions
- Consider other bearing specifications
- Check the processing precision of the shaft and bearing box
- Consider the surrounding design
- Check the mounting method
- Check the lubricant and lubrication method

Scratches

Rough surface with small deposit

Scratches between the flanges of rings and the side surfaces of the rollers

Possible reasons

- Poor lubrication
- Intrusion of foreign matter
- Skewing rollers caused by leaning
- Axial load too big leading to no lubricant on flange surface
- Roughness of the surface too big
- Big sliding of the rolling elements

Solutions

- Re-consider lubricant and lubricating method
- Check application method
- Set proper pre-load
- Reinforce the sealing function
- Use bearings correctly

Environmental Protection

It is one of the strategies to let our employee and partners know and feel more about environmental protection and finally achieve DWCFQ to be a green corporation. We cognize that the best solution is always keep thinking about environmental protection no matter where we are and what we do.

DWCFQ always commit itself to Environmental Protection. Welcome to join us!

DWCFQ Environmental Protection (EP) Responsibility and Commitment

Saving

Energy Saving

26° C room temperature control

Saving electricity, water and paper

Saving packing material (energy consumed during transportation)

Recycle

Categorizing waste of paper, newspapers, magazines

Categorizing wooden rods, cases and blocks

Collecting waste ink and toner cartridges

Collecting waste batteries

Using recycled paper if possible

Education and Promotion

All staff participation: all staff joining green activities or conferences at least once per year

Announcing this KML EP Responsibility and Commitment to our customers and suppliers

Green Environment

Tree planting every year

Increasing the area of greening zone

Reducing Pollution

Using toxic free ink

Minimizing pollutants during production

EP Management System

factories acquiring ISO14000 certificate

Preferably purchasing from ISO14000 certified suppliers if under the same conditions

Quality System

DWCFQ was awarded ISO 9001: 2000 Quality Management System Certificate in 2005. DWCFQ has undertaken to related parties that it will strictly implement and maintain the established quality management system.

To supply the products that meet the customers' requirements, applicable laws and regulations, based on the requirements of ISO 9001:2000 Standard, DWCFQ will identify, establish, implement and continuously improve the following quality management system processes in the light of the specific conditions of the Company:

A. Management Responsibilities

General Manager is expected to be responsible for the following work:

Making quality policy and quality goal regarding the quality management system to satisfy customers gearing with their needs.

Stating responsibilities and power scopes for administrators, executive persons and identifiers as well as describing their correlation to improve the Company's result by satisfying customers.

Appointing major administrators and organizing inner or external exchange activities to improve the consciousness required by customers as well as the validity of the quality management system. This process will imply orientation and duty for other quality management system process.

Meanwhile, the result will be evaluated to continuously improve the quality management system.

B. Resources Management Process

With this process, General Manager will provide necessary resources to realize other quality management processes' orderly and efficient running, aiming at completing quality policy and quality goal, continuously improve the result of the quality management system.

C. Products Realization Process

With focus on the principle of being orderly and efficient, this process includes such work processes as assembling, processing, sale, procurement, logistics and import and export document treatment. As regards the specific service projects required by customers, the Company will figure out related resolutions in accordance with the requirement of ISO9001: 2001 Standard 7.1

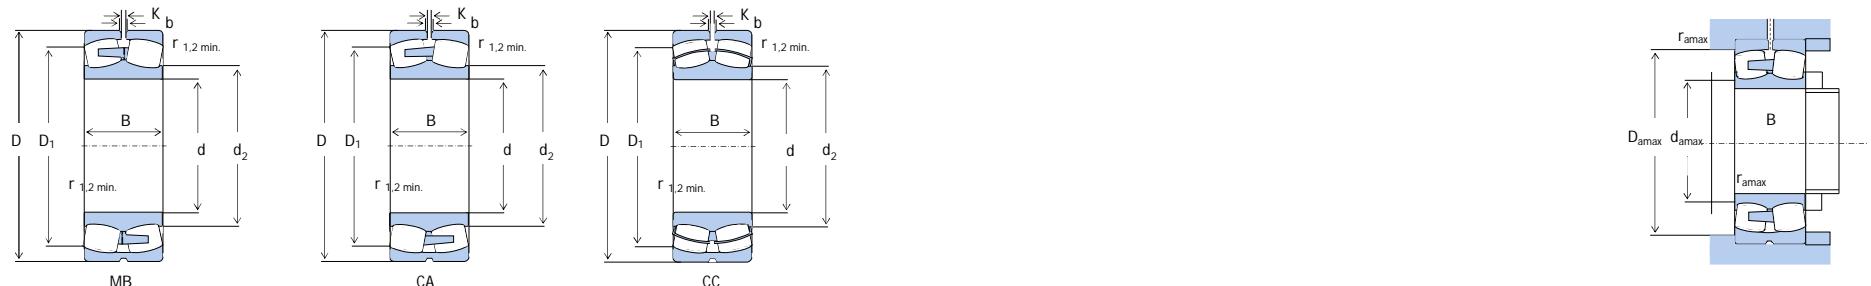

D. Evaluation, Analysis and Improvement Process

General Manager leads and organizes quality system improvement.

Furthermore, customer is the our focus ,we should collect and analyze complain and advices to improve our services .

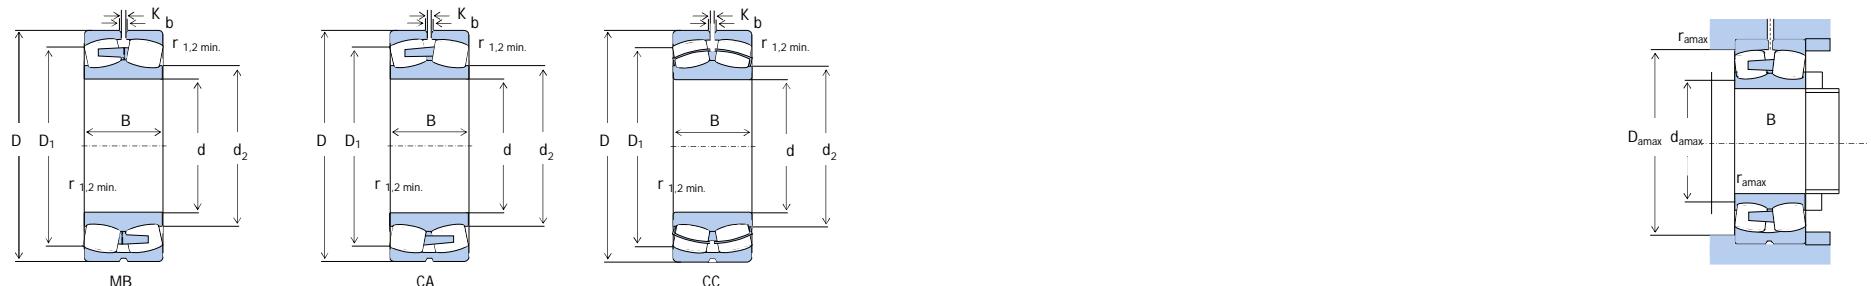

At the same time, company build corresponding control program to manage file ,stuff, record.
